

Money Moves in Silence.

Private messaging for Solana wallets
and Seeker IDs.

Discover on Solana. Talk through cMix.

A wallet is an identity. A chat needs an endpoint.

01

Wallet

A portable public
identity on Solana.

02

Seeker ID

A readable name
for that wallet.

03

Missing link

A messaging endpoint
people can discover.

Solana discovers. cMix carries the conversation.

SOLANA MAINNET / PUBLIC DISCOVERY

x0d.skr → Wallet → Registry → xx endpoint

XXDK / CMIX / OFF-CHAIN MESSAGING

Sender phone → cMix network → Recipient phone

The endpoint is addressing data. Message content stays off-chain.

Two layers. Clear responsibilities.

Solana

- Portable wallet identity
- Public endpoint registry
- Wallet-authorized updates
- Mainnet discovery

xxDK / cMix

- Private message transport
- Off-chain conversation
- Independent messaging identity

Message content is not stored on Solana.

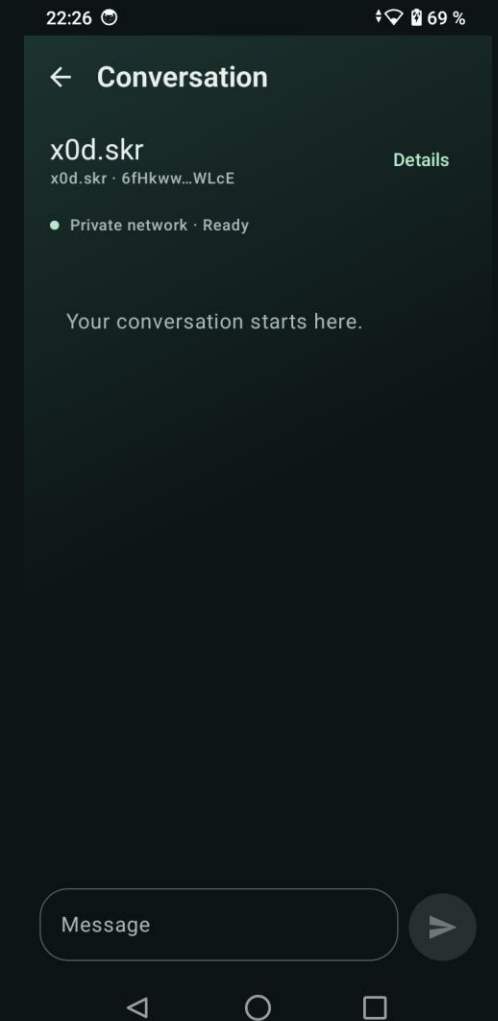

Wallet-to-xx associations are public and historically observable.

A working Android beta.

Validated on a physical Solana Seeker.
Mainnet discovery and production
Mobile Wallet Adapter integration.

Android 10+

.skr, wallet and direct / QR addressing
Messaging identity backup and restore

Actual UI · before sending

Live on Mainnet. Open for review.
